

Your surveyor arrives Thursday.

The record he needs exists. In two places.
That disagree.

He wants one thing.

For **No.2 starting air compressor**: the last completion, and the survey it credits.

That is the whole question.

So you open three things.

- |  The PMS, for the job history
- |  The class records, for the due-date
- |  A spreadsheet from the last drydock

↵ AND HERE IS THE THING

Both systems are right.

CLASS RECORD

**Survey due
14 Mar**

Built for the surveyor.

PMS RECORD

**Job interval
4,000 h**

Built for the engineer.

Different people. Different audits. Twenty years apart.

So why has nobody merged them?

Because it was never a data problem.

Whoever owns the merged record **owns the survey deadline** — and nobody volunteers to be the system that was wrong about a survey date.

THE ARRANGEMENT

They are one object.

Under continuous machinery survey, the class survey due-date and the PMS job due-date are the same object.

So the reconciliation done by hand before every survey is a system being reconciled against itself.

Three failures. Every time.

- 🕒 Running hours entered late
- 📄 A job closed on paper at sea
- 📊 A counter reset nobody recorded

Try it on one machine.

Can you produce the last completion and the survey it credits — from one place, without phoning anyone?

Most fleets cannot. That is not a failure of the crew.

If it takes more than one place, the reconciliation **is the product you are paying for.**
